

A control for people with relatively good foot control

Proportional foot control

Designed for people with a relatively good foot control. The low design of 6 cm (2.36 in) height keeps your foot close to the foot rest. With this proportional control foot movements allow a user to steer and control the wheelchair.

Adjustable to individual possibilities

Fully adjustable to individual possibilities and needs. With straps you can position and tighten the foot and optional safety brackets are available. Further configuration can be done via well-thought out electronics and our Configurator Software.

Widely compatible

Often, alternative controls are made for a single model or brand. mo-vis products are compatible with the most common wheelchair operating systems (R-net, DX, LiNX, Q-Logic).
